

- Check in / Feedback on design
 - Can you set aside some time to lock some things in?
 - Play with the prototype
 - Remove the seed phrase sign in / simple email
 - There's custodial wallets... create an account / keys store on db / set to someones profile
 - But we are starting to move away decentralisation...
 - It's okay for the pilot..
 - We will have tension if we do have it there.
 - We can remove it & redesign it OR we leave it and they learn this step (for when we go to full deployment).
 - It would be good -> We may have to start again... but it's a bridge too far when dealing with the people I'm dealing with.
 - Onboard people / learn this step...
 - We didn't enforce the step -> Jump straight into the app.
 - Looks for notifications -> Says download your key.
 - Downloads a key to the phone.
 - Saves a local digital copy to the phone.
 - Option 1: No mnemonic no recovery
 - Option 2: Save it on the db / they can recover it
 - Option 3: Skip it and do a download (like Ahau), encourage it from notifications.
 - Have a description / treat it as a learning process.
 - We need more info boxes... to help people know:
 - Gareth to work out the narrative... info boxes...
 - If you can create a descriptive table text that lists: The action and description -> We can add it in.
 - Country specific campaigns:
 - Thailand -> Thai
 - Taiwan -> Mandarin
 - NZ -> Eng
 - Australia -> Eng
 - What content to load based on the country?
 - 3 actions for each country -> 12 actions in total
 - 3 campaigns for each -> 12 campaigns in total
 - What is the process?
 - We create the process for you or a table... with all the different contributions, campaigns, photos and descriptions.
 - Within the week -> If we can have the NZ stuff asap then we can use that to plug it in.
 - Card has a picture, title and action... click on the card and it opens up a webpage.

- In app or out of app?
 - Out of app / completing the action on another app means added complexity.
 - **Choice:** In app / pop up instead.
- ACTIONS:
 - Sign a petition:
 - What info is captured from the user... we don't want to double handle it... we can sit with the app / batch export the info AFTER is fine.
 - The user should get one email to confirm they have signed up and sent back to the registration page.
 - They can have the one email check what else -> Go to the app.
 - By the user / status / back end updates.
 - Share on social media:
 -
 - Attend a protest:
 - QR code activated, hits a webserver -> knows to open AmnestyDAO -> It's a bigger piece of work.
 - It was a stretch
 - Human energy
 - Read this... you can donate your time / energy for your efforts.
 - Time how long a person spends on a page.
 - Opened here
 - Spend a certain amount of time
