

DAO governance app — feedback summary

36 respondents · NZ, Australian & international participants · Jan–March 2026

This report summarises participant feedback from the AmnestyDAO MVP pilot conducted between January and March 2026. A total of 36 participants across Aotearoa New Zealand, Australia, and international workshop cohorts engaged directly with the DAO governance application and provided structured feedback on usability, governance potential, and overall experience. The findings indicate a strong baseline of usability and engagement, with participants consistently describing the platform as intuitive, accessible, and aligned with Amnesty’s mission. At the same time, respondents raised important considerations regarding governance design, fairness, and participation dynamics. Taken together, the feedback provides a robust evidence base for evaluating the MVP, demonstrating its functional viability while clearly identifying the key areas for refinement as the project moves toward broader deployment and scale. Participant feedback was distributed across multiple dimensions, with strong engagement not only on usability and experience, but also on governance design, fairness, and system integrity. This indicates that participants engaged with the platform at both a functional and conceptual level.

36 Total respondents across all groups	83% Rated UX smooth or intuitive	78% Would use a refined version	61% Raised governance concerns

SELECTED PARTICIPANT QUOTES

"The balance dashboard makes tracking live points feel rewarding, encouraging ongoing interaction."

— Tom

"A small number of users gaining a large number of DAO points could have an outsized influence on decision making."

— Nishad

"There could be really valuable uses for the DAO to help with message testing to understand which messages resonate."

— Sarah

"The immediate granting of tokens after a completed action gives a gratifying feeling that has real potential."

— Anne

"I suggest not mentioning the term 'decentralised' — most people don't understand what blockchain means in this context."

— David

"The app overall is so simple and straightforward — you understand the process even without a tutorial."

— Matteo

"It was really easy to understand the concept and easy to do the actions and spend the tokens."

— Lyana

"Having the ability to receive and spend tokens gives a quantitative measure of engagement I find genuinely compelling."

— Carlo

Summary Insights and Design Implications

Taken together, the pilot feedback demonstrates a high-functioning MVP that successfully translates complex governance concepts into an accessible and engaging user experience. Participants consistently reported strong usability and clarity, with the majority able to navigate the platform and complete actions without difficulty. The system's core interaction model – linking participation to token-based rewards – was widely understood and described as motivating, intuitive, and aligned with Amnesty's mission.

Beyond usability, the feedback reveals a clear appetite for more participatory and transparent forms of governance. Participants recognised the potential of the DAO model to broaden engagement, democratise input, and create new pathways for supporter involvement in decision-making. Importantly, this interest was not passive; users engaged critically with the model, raising thoughtful questions about fairness, representation, and governance integrity.

These concerns highlight the next phase of development. Issues such as concentration of influence, accessibility of participation, and alignment with Amnesty's core values are not technical limitations, but design challenges that will shape the system's legitimacy at scale. The pilot confirms that while the underlying technology is functional, the success of the platform will depend on how governance mechanisms are structured, communicated, and safeguarded over time.

A further insight emerging from the feedback is the tension between simplicity and expressiveness in the user experience. While the mobile-first design was effective in delivering clarity and ease of use, participants signalled a desire for a more dynamic and engaging interface. This points toward a future design direction where richer interaction layers and visual feedback can be introduced progressively, without compromising accessibility or usability across devices.

In summary, the MVP has achieved its core objective: demonstrating that a Human Rights DAO can be made tangible, usable, and engaging for real participants. The next stage is not to prove the concept, but to refine and scale it – strengthening governance design, enhancing user experience, and building the trust and clarity required for broader adoption.
